

Why does $0.999999\dots$ (bigger decimal no) equals 1 in JS?

↳ JS follows IEEE 754 double precision floating point format

↳ It can only store about 16-17 decimal digits of precision

↳ Anything beyond that is rounded up.

Power Operator : Exponentiation

$$2^3 \longrightarrow 2^{**}3 = 8$$

NaN - Not a Number - The NaN global property is a value representing invalid number (not-A-number)

ie: $0/0$
NaN - 1
NaN * 1
NaN ÷ NaN

} o/p is NaN

Operator Precedence :

()
**
*, /, %
+, -

○ Keywords

① `let` keyword $\rightarrow$ declare variables (`var` can be used but has lower scope)

```
let b = 10 ;
```

```
b = b + 1 ;
```

o/p : 11

② `const` $\rightarrow$ value of constants can't be changed

```
const num = 10 ;
```

```
num = 11 ;
```

o/p : error

○ Assignment operators : `a = a + 1 ;`
`a += 1 ;` 

○ Unary operators : `a += 1 ;` `a -= 1 ;`
`a++ ;` `a-- ;`

1) Pre-increment / Pre-decrement (change, then use)

```
++a ;
```

```
--a ;
```

2) Post-increment / Post-decrement (Use, then change)

```
a++ ;
```

```
a-- ;
```
