

Array Methods

◦ `forEach` → `arr.forEach (some function definition / name);`

```
ex: let arr = [1, 2, 3, 4, 5];  
function print (el) {  
    console.log(el);  
}  
arr.forEach (print);
```

OR

```
arr.forEach (function (el) {  
    console.log(el);  
});
```

◦ `map` → takes a callback function and stores the return value in an other array.

```
let num = [1, 2, 3, 4];  
let double = num.map (function (el) {  
    return el * 2;  
});
```

filter takes a callback function and stores the boolean value (true or false) on another array.

if true $\rightarrow$ el ✓

false $\rightarrow$ el ✗

Ex: `let num = [1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11];`

`let even = num.filter(el) => {`

`return el % 2 == 0;`

`} );`

$\hookrightarrow$ // even = true
odd = false

o/p: `[6] [2, 4, 6, 8, 10]`

every - returns true if every element of array gives true for some function.

Similar
to
AND
operator

- else returns false.

Ex:

`[2, 3, 4, 6].every((el) => (el % 2 == 0));`

o/p: - false

`[2, 4, 6].every((el) => (el % 2 == 0));`

o/p: - true

• some

Similar
to
OR
operator

- returns true if some element of array gives true for some function.

- else returns false.

Ex:

[2, 3, 4, 6]. some ((el) => (el % 2 == 0));

o/p :- false

[2, 4, 6]. some ((el) => (el % 2 == 0));

o/p :- true

• reduce
